Annex VIII – Images

Image 1 and 2. Example of interchangeable use of drugs for severe malaria during a course of a treatment

In the first image, the patient received artesunate IV and two days later artemether. In the second image, that patient received first artemether and later artesunate IV.

Image 3. Example of use of artemether misused

The patient continues to receive artemether even when it is stated that the patient is already eating normal.
Both CHWs and health facilities have referral sheets where basic information is supposed to be registered: a brief description of symptoms and vital signs and the reason for referring.
A common mistake is wrongly double adding the number of pregnant women. For example, the number of medical appointments performed for children under five were 171, for children from 5 to 14, 250, for above 14, 102 and pregnant women 50. The total of medical appointments performed is the sum of the performed for children under 5, children 5 to 15 and above 14, 523 and not 573 as indicated in the report.

According to the first table, the number of RDTs performed were 320 (sum of the positive and negative results) but in the last table is referred that the number of RDTs consumed were 220.

There is a lack of diagnosis tests registry.
